INTRODUCTION

Manual 2, volume IB, contains the logic drawings for the UNIVAC Solid-State Computer system with magnetic tape, RANDEX® drum files, the card-punching printer (CPP), core storage, dual tape synchronizers*, and paper tape. The drawings in this volume are numbered *1-1B*, *1-2B*, and so forth. The designation *1-* indicates that drawing is in volume 1; the letter *B* distinguishes these drawings from others published at an earlier or later date.

This volume presently contains the logic drawings for the following USSC systems:

Models 130A and 154 — including the 90-column tower read-punch unit;

Models 131A and 159 — including the 80/90-column Bull read-punch unit;

Model 139 — including the CPP;

Models 176 and 184 — including core storage, dual tape synchronizers, and paper tape.

The same manual drawing numbers have been assigned to drawings which represent different models. The model number(s) for each drawing is included in the manual title. Models 130A, 131A, 154, 159, 176, and 184 use the I/O Synchronizer Tape/RANDEX (models 146 and 153), the logic drawings of which are contained in manual 2, volume III.

Sections of the volume-IB drawings not common to all models of the USSC system are enclosed in labeled boxes which are identified as follows:

IdentificationSystem		IdentificationSystem	
C80	80-column card only	TR	System with magnetic-tape and RANDEX only
C90	90-column card only	CPP	System with card-punching printer only
T80	80-column magnetic-tape only	R	RANDEX system only
T90	90-column magnetic-tape only	2HSP	System with two high-speed printers only
80	80-column only	C	System with core storage
90	90-column only	DS	System with dual tape synchronizer
T	Magnetic-tape only	PT	System with paper tape
IR	System with index-registers only		

®Registered trademark of the Sperry Rand Corporation.
* The system with dual tape synchronizers may consist of two model 153 synchronizers (tape only) or one model 153 and one model 146 (tape/RANDEX) synchronizer.

The following information concerns all drawings: Signal names in boxes with a dagger(†) are only input or output signals for the model number referenced by the dagger.

The NM and SM signals are interchangeable. Signals that appear on the drawings with a prime (such as *TB'2*), will be typed out in a signal glossary printout with the letter *V* substituted for the prime (*TBV2*).

Tables 1-1 through 1-4 supply a cross-reference from the manual drawings to the engineering logic diagrams. Although the same basic processor is used in all USSC systems, each processor model is represented by a sepa-

rate engineering-drawing series. Thus tables 1-1 through 1-4 are oriented by processor model numbers; each manual drawing number is keyed to a processor model number which is, in turn, keyed to a specific engineering-drawing series. For complete reference accuracy, the processor model number must be taken into account when the engineering sources are consulted. The revision column indicates the revision level at which the 1B drawings were prepared.
